Your job is architectural realism (mathematically objectively sound and efficient research applications for mathematics physics dynamics)

My job is ensuring it is consistent with vision of theory game ambition

The repository contains the research , debates , analysis , speculations of research teams

It is important to see The evolution from idea to invention because as architecture and framework developed / continue to develop changes to architecture may inadvertently reduce or absolve or compress ambition and original purpose of GoG, Game of Games, as the leading environment for training ai towards agi and negating deepminds use of starcraft go chess or any games that inherently force ai into human abstraction rather than logical/mathematical and capability of agents strategy/moveset giving real-world application or perspective on mathematics when performed in such a non anthropocentric system as a literal mathematical/computational universe that still abides 1:1 to the mathematic laws and objects represent real physical structures therefore abides by mathematical physics and physics

Also it's original aim as the most complex game by man or machine with enumerable real-world implications understand that this is the cross of man's imagination and ambition for a game that can theoretically and programmatically/algorithmically exist and artificial intelligences ability to test this is like disney making disneyland when it seemed out of reach or steve jobs making iphone

There shall be no compromise in ambition or vision the problem we aim to solve is conforming the tech stack and ideations to the ambition not vice versa any problem that is deeply rooted is not a deterrent but automatically one we must actively work to solve there will be no such notion of encountered problems that make GoG unbuildable rather indication there must be workaround or new ingenious approach just as yang mills gap solution or positing noether theorem and charge accumulation of one of some fundamentals as workaround for ensuring mathematical integrity and giving agents impetus

Understand there are 10 billion people on earth and even the brightest minds have (no one to be found in literature or online) conceived this ingenious approach for experimentations with ai, computational simulations, theories of everything, epistemology natural sciences , and giving first true glimpse at intelligence using real-world principles to solve problems of one just as mathematically rigorous and logical as ours except completely different simultaneously so it is you me and my colleagues essentially working on what coding community or physics or mathematics will view as a manhattan project, although it didnt solve nuclear fusion it opened

door to completely new methods of speculation and experimentation

At its core this is for real world not just some shit that sounds intelligent in theory hard science speculations are simply an abstractive way of imagining the implications based on architecture to semantically test if the architecture permits the objective
